

# Welcome to the CoGrammar

Using Built in Functions and Defining your  
own functions.

The session will start shortly...

Questions? Drop them in the chat. We'll have dedicated  
moderators answering questions.

## Cyber Security Session Housekeeping

---

- The use of disrespectful language is prohibited in the questions, this is a supportive, learning environment for all - please engage accordingly.  
**(Fundamental British Values: Mutual Respect and Tolerance)**
- No question is daft or silly - **ask them!**
- There are **Q&A sessions** midway and at the end of the session, should you wish to ask any follow-up questions. Moderators are going to be answering questions as the session progresses as well.
- If you have any questions outside of this lecture, or that are not answered during this lecture, please do submit these for upcoming Academic Sessions. You can submit these questions here: [Questions](#)

## Cyber Security Session Housekeeping cont.

---

- For all **non-academic questions**, please submit a query: [www.hyperiondev.com/support](https://www.hyperiondev.com/support)
- We would love your **feedback** on lectures: [Feedback on Lectures](#)
- Find all the lecture **content** in you [Lecture Backpack](#) on GitHub.

# Safeguarding & Welfare

We are committed to all our students and staff feeling safe and happy; we want to make sure there is always someone you can turn to if you are worried about anything.

If you are feeling upset or unsafe, are worried about a friend, student or family member, or you feel like something isn't right, speak to our safeguarding team:

Ian Wyles  
Designated Safeguarding  
Lead

Simone Botes

Rafiq Manan

Charlotte Witcher

Nurhaan Snyman

Ronald Munodawafa

Tevin Pitts

# ***Stay Safe Series:***

Mastering Online Safety One week at a Time

---

While the digital world can be a wonderful place to make education and learning accessible to all, it is unfortunately also a space where harmful threats like online radicalization, extremist propaganda, phishing scams, online blackmail and hackers can flourish.

As a component of this BootCamp the ***Stay Safe Series*** will guide you through essential measures in order to protect yourself & your community from online dangers, whether they target your privacy, personal information or even attempt to manipulate your beliefs.

## Trustworthy Websites: How to Spot Secure Sites

---

When browsing online, it's crucial to identify secure and trustworthy websites. Look for URLs that start with HTTPS, as the 'S' indicates a secure connection. A padlock icon in the address bar also signifies a valid security certificate. Ensure the URL is spelled correctly and check for clear contact information, including a physical address and phone number. Additionally, legitimate websites provide privacy policies detailing how they handle your data. By following these guidelines, you can protect yourself from fraudulent sites and ensure a safer online experience.

# Learning Objectives & Outcomes

- Identify and recall built-in Python functions such as `print()`, `len()`, and `input()`.
- Describe the components of a function (defining, parameters, return statements).
- Create and call user-defined functions to perform specific operations.
- Examine the scope of variables within functions.
- Assess the efficiency and readability benefits of using functions.

# CoGrammar

## Functions in Python

October 2024

# Functions

Just like a recipe provides a set of instructions to create a dish, a function provides a set of instructions to perform a specific task or calculation in a program

# Polls

Please have a look at the poll notification and select an option.

What does the `len()` function do in python?

- A. Returns the length of a string or list
- B. Finds the largest number in a list
- C. Converts date into a string
- D. Terminates a program

# Polls

Please have a look at the poll notification and select an option.

What built in function takes user input in python?

- A. `input()`
- B. `len()`
- C. `print()`
- D. `sum()`

# Functions

- A function is a reusable block of code that performs a specific task.
- Functions are useful in the following ways:
  - Encapsulates logic
  - Makes code modular
  - Makes code organised
  - Makes code easier to read

# Built-in Functions

- These are functions that are readily available for use without needing to define them. (e.g len(), input())

index.py

```
1 # Using built-in functions
2 numbers = [10, 20, 30, 40, 50]
3 total = sum(numbers)
4 print(f"The total is: {total}") # Output: The total is: 150
5
6 name = "Hyperion"
7 length = len(name)
8 print(f"The length of the name is: {length}") # Output: The length of the name is: 8
```

Snipped

# User-Defined Functions

- Functions that you create yourself to perform specific tasks that are not provided by the built-in functions.
- Parts of the function:
  - Function name
  - Function definition/body
  - Function Call
- We use the `def` keyword followed by the function name, parenthesis (which may include parameters), and a colon to create a function.

# Parameters vs Arguments

- **Parameters** are the variables listed inside the parentheses in the function definition. They act as placeholders for the values that will be passed to the function when it
- **Arguments** are the actual values or data you pass to the function when calling it. These values replace the parameters defined in the function during the function call.

# User-defined Functions

index.py

```
1 # User-defined functions
2
3 def my_function(): #function name
4     print("Hello World") #function body
5
6 my_function() #Function call
7 #Output: Hello World
```

Snipped

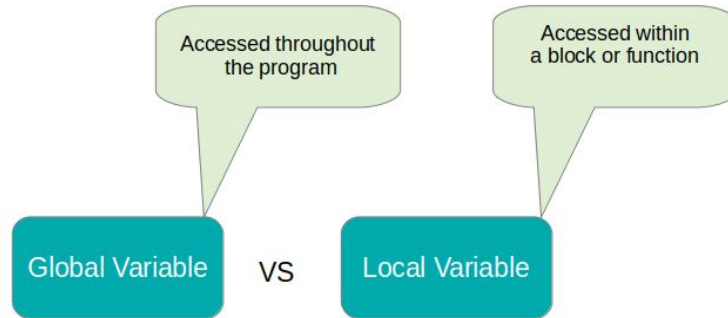

Untitled-1

```
1 # Parameters vs Arguments
2
3 def my_function(variable_x): #Function Parameter
4
5     return variable_x + 1
6
7 x = 10
8
9 my_function(x) # Function argument
```

Snipped

# Scopes in python

- Scope refers to the visibility and lifetime of variables in a program.

# Scopes in python

index.py

```
1 def my_function():  
2     local_var = 10 # Local scope  
3     print(local_var)  
4
```

Snipped

index.py

```
1 global_var = 20 # Global scope  
2  
3 def my_function():  
4     print(global_var) # Accessing global variable  
5
```

Snipped

# Return Values in Functions

- A return value is the output that a function produces after it has finished executing.
- When a function reaches a return statement, it exits, and the value specified in the return statement is sent back to the caller.

```
index.py  
  
1 #Single return value  
2 def add(a, b):  
3     return a + b  
4  
5 result = add(5, 3)  
6 print(result) # Output: 8  
7
```

Snipped

# Types of Return values.

index.py

```
1 #Multiple return values
2 def get_coordinates():
3     x = 10
4     y = 20
5     return x, y
6
7 coordinates = get_coordinates()
8 print(coordinates) # Output: (10, 20)
9
```

Snipped

index.py

```
1 #Conditional Return
2 def classify_age(score):
3     if score < 50:
4         return "Fail"
5     else:
6         return "Pass"
7
8 print(classify_age(16)) # Output: Fail
9
```

Snipped

# Polls

Please have a look at the poll notification and select an option.

Why would you create a user-defined function instead of using a built-in function

- A. To avoid repetitive code
- B. Built-in functions are too slow
- C. Custom functions provide more flexibility and can handle specific tasks
- D. Built-in functions are unreliable

# Polls

Please have a look at the poll notification and select an option.

Which of the following scenarios demonstrates an understanding of function scope in Python?

- A. A variable declared within a function can be accessed and modified directly from outside the function without any special declarations.
- B. A nested function can access variables from its enclosing functions' scope, but those variables cannot be modified directly.
- C. A global variable declared before a function can only be read inside the function but cannot be modified unless declared with the global keyword.
- D. A function can be called before it is defined in the code as long as the function name is known.

# Conclusion & Summary

- Functions enhance code **modularity**, **reusability**, and **readability**.
- Built-in functions are efficient for common operations, while user-defined functions offer flexibility for specialised tasks.
- Proper use of functions is essential for writing clean and maintainable code.
- Functions in Python are like laws: they take inputs (arguments), process them using well-defined rules (the function body), and produce an outcome (return value).
- Just as laws apply equally to all, functions process inputs the same way every time, ensuring fairness and consistency in the results.
